

# Homepage Content Not Visible to Google or AI Crawlers — Technical Issue Report

---

## Summary

Hydro Boost homepage content is not visible to Google's search crawler, and is very likely invisible to AI crawlers (ChatGPT, Perplexity, etc.) as well. I confirmed this directly using Google Search Console, and I'm flagging it because it affects our homepage's ability to rank in search or be cited by AI tools at all — right now, as far as Google can tell, our homepage is close to blank.

This is a technical/architecture issue, not something fixable through the Wix dashboard or editor, so I'm bringing it here for a decision on how to proceed.

---

## Root Cause

Our homepage isn't built natively into the Wix site — the hero section, product highlights, and mission content are custom code hosted separately on **Vercel**, and Wix pulls that content in through an `<iframe>` embed.

Content inside an iframe is treated as a *separate document* by most crawlers. Googlebot can sometimes read simple iframe content, but it's unreliable — and most AI crawlers (which tend to be less sophisticated than Googlebot and often don't execute JavaScript or follow iframes at all) are likely to see nothing but an empty shell where our homepage should be.

---

## What I've Tried / How I Confirmed This

1. **Google Search Console** → **URL Inspection tool**, tested against <https://www.buyhydroboost.com/>
  - Result: **"URL is on Google"**  (page is indexed and crawlable at a basic level)
  - Crawl allowed: Yes / Indexing allowed: Yes

- Title tag, meta description, canonical tag, and HTTPS were all confirmed correct
- 2. **Viewed the "Crawled Page" HTML** in Search Console
  - The `<head>` section (title, meta tags, canonical, Open Graph tags) all rendered correctly
- 3. **Viewed the "Screenshot" tab** in Search Console (this shows literally what Googlebot rendered/saw)
  - **Result: the header and nav bar displayed correctly, but everything below it — the hero content, product highlights, mission section — was completely blank/black.** This is the core evidence: Google is not seeing our actual homepage content.
- 4. **Checked "More Info" tab** (page resources and console errors) to rule out a simpler cause
  - 7–65 out of ~150–270 page resources failed to load across two test runs, but on inspection these were all **Wix's own internal analytics/tracking calls** ([frog.wix.com](https://frog.wix.com), [panorama.wixapps.net](https://panorama.wixapps.net), site-member session checks) — not anything related to our actual content. This rules out "a broken resource is causing the blank content" as the explanation.
  - One JS console message was a harmless preload warning (unused cart icon script), not a real error.

**Conclusion from testing:** the blank content isn't caused by a broken script or failed resource — it's specifically the iframe's nested content not being picked up by the crawler. This matches known, documented behavior for iframe-embedded content and crawlers.

---

## Why This Matters

- **Search ranking:** if Google can't read our homepage's actual message/content, it severely limits how well the homepage itself can rank for anything — Google can't index what it can't see.

- **AI visibility (GEO):** AI answer engines and shopping assistants (ChatGPT, Perplexity, Google AI Overviews, etc.) are generally less capable than Googlebot at reading JavaScript-heavy or iframe-nested content. If Googlebot sees a blank page, it's very likely these tools see nothing at all — meaning we're currently invisible to AI-driven product discovery on our own homepage.
  - **Core Web Vitals / page speed:** the iframe pattern also adds a second network round-trip and render pass, which can independently hurt Largest Contentful Paint and other speed metrics, separate from the indexing issue.
- 

## Recommended Options

### Option A — Stop using the iframe (recommended, permanent fix)

Right now, our homepage content lives on a separate site (Vercel) and gets "embedded" into Wix through an iframe, kind of like a window showing content from somewhere else. Instead, we'd set things up so that content is delivered directly at buyhydroboost.com — no embedding, no separate window, just one single page.

- Google and AI tools would see one complete page, instead of a shell with hidden content inside it.
- We keep our own URL and full control, the visibility problem just goes away.
- This part needs engineering support — it's a server/routing-level change on the Vercel side, not something adjustable through Wix.

### Option B — Make the embedded content load faster and more complete (partial fix, if Option A isn't possible yet)

If we have to keep the iframe setup for now, we can at least make sure the Vercel site sends its actual text content right away, instead of building the page piece-by-piece after loading (which is what search/AI crawlers often miss).

- This gives crawlers a better chance of actually seeing our content, even with the iframe still in place.
- It's not as reliable as fully removing the iframe, but it's a smaller, faster change to make in the meantime.
-

### **Option C — Do nothing / deprioritize**

Not recommended. Since this affects the homepage specifically — typically our highest-authority, most-linked-to page — leaving this unresolved caps our search and AI visibility at the root of the site, regardless of how well we optimize every other page.
